

Tutorial Problem Set #1

- Sample executables can be found in the course git repository directory (run `git pull`).
- Completing the problem set will reduce the weight of the final exam by 0.5%. To complete a problem set, you must pass at least 50% of the secret tests.
- You may assume all input is valid. Tutorial problems NEVER require checking for invalid inputs.
- You may only import the following libraries: `iostream`, `string`, and `sstream`.

Question

In this question, your program will continually receive text via standard input until EOF is reached. Upon reaching EOF, your program should print the line from the text that contains the fewest words, followed by the line from the text that contains the most words. You may assume that input will contain at least one line.

In the event of a tie, report the first line in the tie. For example, given the input (which happens to be a haiku):

```
b07 taught me
the heap holds objects until 1 delete
delete frees memory
```

The output of the program should be:

```
b07 taught me
the heap holds objects until 1 delete
```

Although the lines `b07 taught me` and `delete frees memory` both contain the fewest number of words (3), we report only the first line.

In the event that all lines have the same number of words, print the first line twice.

A word is considered anything that `operator>>`, when used to read from an input stream into a `string`, considers to be a word.

Submission

Submit your solution in a file called `main.cc`. Save your file in the folder `tutorial1` in the MarkUs repo and push the changes. Remember to run `git pull` before submitting your file if you don't see the `tutorial1` folder in your local copy of the repo.
